There are two functions: sendPacket (sends) and getPacket (receives). Both I believe work the same way by which the first value is just the data size, followed by the value you want in it.

Example:

Code: Select all

```
sendPacket(1, 0x16, 4, 0x4, 4, parseInt(gId), 4, 0);
```

You are placing 0x16 in 1 byte, 0x4 in 4 bytes, parseInt(gId) in 4 bytes, the value 0x0 in 4 bytes. So it would look like:
[16][04 00 00 00][some 4 byte value][00 00 00 00]

Code: Select all

```
getPacket(1, 0x77, 1, 0x0c);
```

Just like the sendPacket, you are placing 0x77 in 1 byte, 0x0c in 1 byte. Would look like:
[77][0C]
